Download

2.Wi-Fi Dongle preparation

Make sure your Wi-Fi Dongle is installed on the inverter and is running well. The details refer the Part.7of ‘APP User Manual’ delivered with the product module.

3.Communicate with your inverter via APP

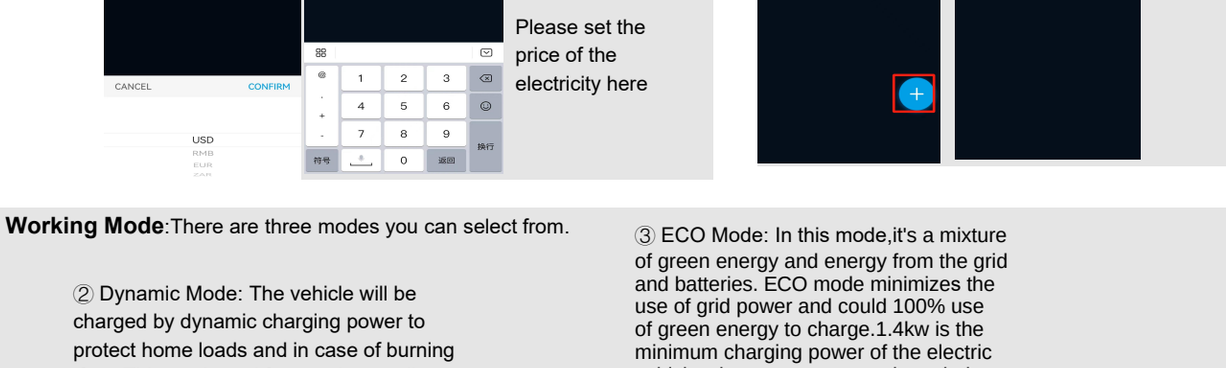
STEP 1
Open the App and enter the homepage.
Click ‘Local mode’.

STEP 2
Click ‘BlueTooth Mode’ in the list.

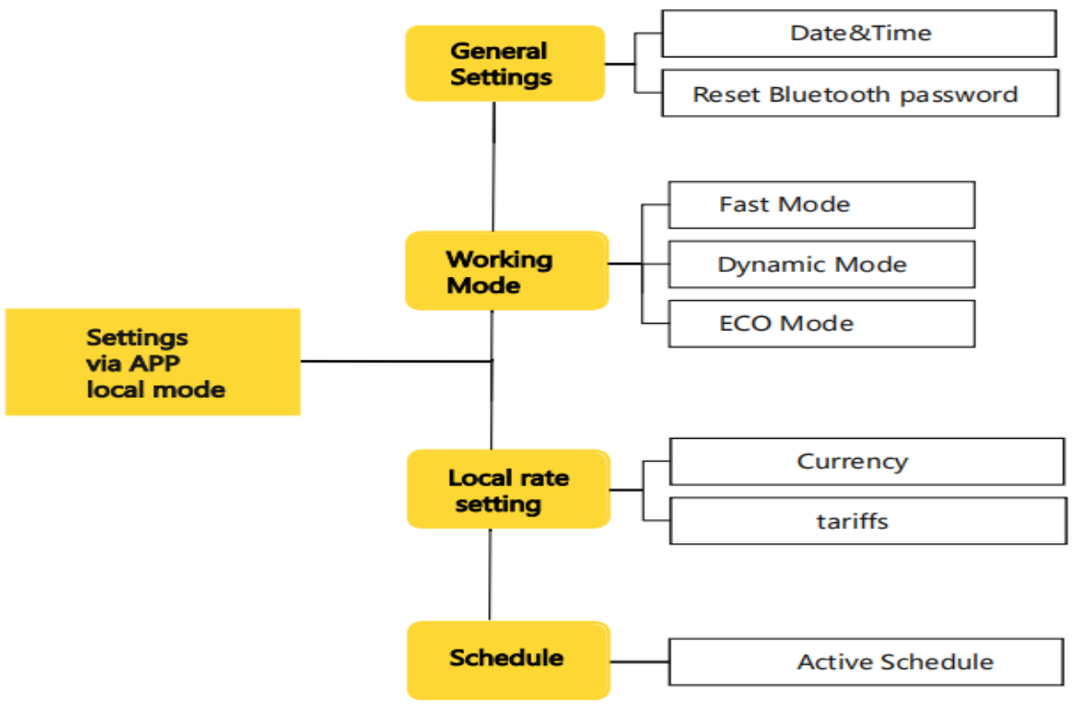
STEP 3
Choose your device .
(A few tail numbers of SN are device’s name.)

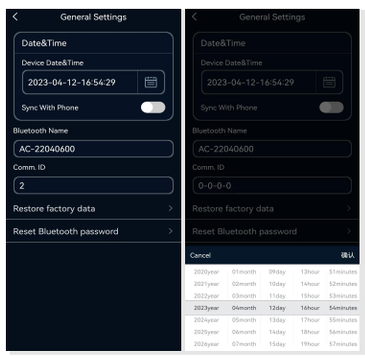
STEP 4
Enter your device status page.
Click the ‘ ⚙ ’ icon

Settings page
Now, you can set initial parameters here.



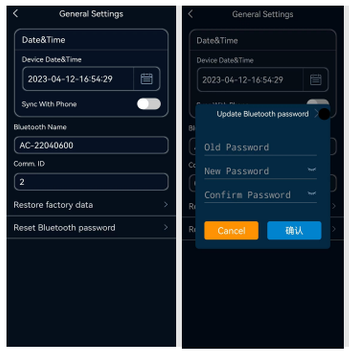
4.Initial parameter Settings





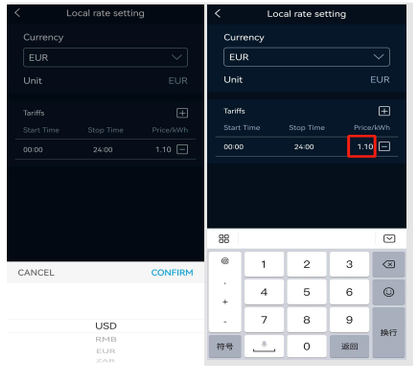
Date & Time

Synchronize with phone and can be set by yourself.



Reset Bluetooth password

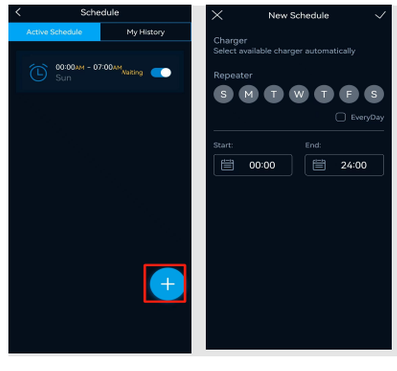
The password can be set by yourself



Local rate setting

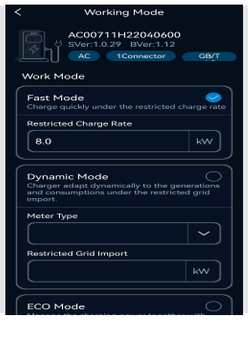
Please set the currency here

Please set the price of the electricity here



Schedule

Schedule charging plan here according your needs



① Fast Mode： The charger can charge the electric vehicle according to the max charging power set by the user.

Working Mode:There are three modes you can select from.

② Dynamic Mode: The vehicle will be charged by dynamic charging power to protect home loads and in case of burning fuse.This mode and fast mode are all adaptive with solar system.This mode needs the charger to communicate with the general electricity meter of the power grid.

③ ECO Mode: In this mode,it's a mixture of green energy and energy from the grid and batteries. ECO mode minimizes the use of grid power and could 100% use of green energy to charge.1.4kw is the minimum charging power of the electric vehicle,when green energy drops below 1.4kw，extra power will be drawn from Livoltek battery or the grid to protect your car. This mode needs the charger to cooperate with the inverter and the general electric meter of the grid.
